Smart solution for railways

Create a code snippet using python to

1. Extract weather data from OpenWeatherMap using APIs
2. Send the extracted data to the cloud
3. Receive data from the cloud and view it in the python compiler

The screenshot shows a web browser window with multiple tabs open. The active tab is 'home.openweathermap.org'. The website header includes the OpenWeather logo and navigation links: Weather in your city, Guide, API, Dashboard, Marketplace, Pricing, Maps, Our Initiatives, Partners, Blog, For Business, yoge..., and Support. A green confirmation message states: 'We have sent the confirmation link to yogeshk0333@gmail.com. Please check your email.' Below this is a horizontal menu with links: New Products, Services, API keys, Billing plans, Payments, Block logs, My orders, My profile, and Ask a question. The main content area features a large image of a sunset over a body of water. To the right of the image, the text reads: 'Historical weather for any location'. Below this, it says: 'Our new technology, Time Machine, has allowed us to enhance the data in the Historical Weather Collection.' Two bullet points follow: 'Historical weather data available for ANY coordinate' and 'The depth of historical data have been extended to 40 YEARS'. A line of text states: 'You can download data from Personal account or contact us to order it.' At the bottom of this section are two orange buttons: 'Learn more' and 'Go to purchase'. The footer of the website includes the text 'Weather Dashboard' and 'Activate Windows. Go to Settings to activate Windows.' The Windows taskbar is visible at the bottom of the screen, showing the time as 12:54 PM.

OpenWeather Weather in your city Guide API Dashboard Marketplace Pricing Maps Our Initiatives Partners Blog For Business yoge... Support

Weather in your city

chennai Search

Chennai, IN scattered clouds

31°C temperature from 31 to 31 °C, wind 4.63 m/s, clouds 40 %, 1010 hpa

Geo coords [13.0878, 80.2785]

Search engine is very flexible. How it works:

- To make it more precise put the city's name, comma, 2-letter country code (ISO3166). You will get all proper cities in chosen country. The order is important - the first is city name then comma then country. Example - London, GB or New York, US.

Plesk Control & Simplify your WebOps SIGN UP

29°C Cloudy

weatherMap.py - E:/IBM/pre/weatherMap.py (3.6.3)

File Edit Format Run Options Window Help

```
import requests
a = "https://api.openweathermap.org/data/2.5/weather?q=Chennai,IN&appid=6d13d12f9cd34a07871a5795d01e2c47"
r = requests.get(url = a)
data = r.json()
print(r)
print(data)
temp = data["main"]["temp"]
hum = data["main"]["humidity"]
print("Temperature is : ",temp)
print("Humidity is : ",hum)
